# Software Solutions for the Environment

# ESUG General Meeting 2019-04-23

### Nick Casey, Anatrack

INTRODUCTION

I am the engineer for Anatrack and develop all the software.

I am what is known as a Full Stack Engineer which means that I can do all parts of an enterprise software project, coding in many programming languages, database management, front end design and hardware commissioning, though this now all virtualised on the Cloud. I do the software analysis, costing and system architecture, the build, release and support. I try to persuade others to do the testing: developers should not test their own products.

I live and work in Devon, in the west of England, and this is view from my office window.

### QUALIFICATIONS

I went to Oxford University to study engineering science Then went on to do a research degree in digital audio signal processing at York

### WORK EXPERIENCE

I have had many roles, developing audio analysis tools, document management systems, an advertising engine and lots of web applications. In the year of the millennium I helped build an early web site that builds web sites, more on which later.

### WORKING FOR ANATRACK

I jumped at the chance of a job at Anatrack when Robert offered it. This would allow me to help save species while remaining hands on with software development.

### RANGES AND THE MAPPER

Anatrack's original product is Ranges which a tool for animal researchers to analyse data received from tracking devices, radio or GPS tags, attached to animals.

Robert started developing Ranges in the 1980s and it is now in version 9, running on Windows and Apple Macs

Another early product was a species mapper for the TESS initiative. This consolidated our knowledge of mapping software, useful as there is a mapping element in nearly all our solutions.

All of Anatrack's other projects involve content management systems (which I might call CMSes), or web sites that build web sites, as mentioned before

### NATURALLIANCE

We started with Naturalliance mark I, our first portal for sustainable use.

It consists of a backend, which allows site editors to login and edit the site content.

Pages on different subjects can be created, filled with text, images and links, and added to the menu for access

Importantly, there are tools in the backend to allow translation of the text into multiple languages

As they are working, the editors can view a preview of the site

and once the content is written and translated, the site can be published so that that it is visible to everyone on the Web

We contracted professional graphic design for Naturalliance, and as such is, or at least was, the prettiest of our web sites to date

but style trends change quickly on the Web and after ten years it is looking a little old fashioned

these days we stick to Google- and Wikipedia-inspired black on white with standard fonts

### It had other important features

users interested in the sustainable use of nature could register on the published site it was connected to a payment engine so that we could take donations

### SAKER AND PERDIX

We further developed the Naturalliance platform for species-specific portals, sakernet.org for the saker falcon, limited to Middle Eastern languages and Russian

and perdixnet.org for the grey partridge, limited to the languages of Europe.

### MORPHmaster

But we realised that the code for all of these was essentially the same, and that we should manage one system to cover all of them. The MORPHMaster content management system is the culmination of this and now houses

SakerNet, PerdixNet, the brand new AmFalCon.org and Naturalliance.org, which is at naturalliance.org

each instance of the platform allows the editor to select the languages they are to be translated into

it has editable sponsorship content

and comprehensive user registration functionality for mailing lists

It uses state of the art cloud hosting on Amazon Web Services and is easily scalable if, as we hope they will, the web sites start to get busy.

### SYCL

SYCL (The System For Community Liason) is a content management system of a different kind, and hosts dozens of web sites.

# While the Morphmaster back-end tools are in English, the SYCL back end is translatable, which means that editors can create web sites in the language of their choice, using tools that they understand.

There is a range of page types available to SYCL, including different ways of presenting content and links. You can add events and classified advertisements. You can create a set of image galleries, and you can add Google maps to the site, annotated with key locations, boundaries and paths, created using a tool within SYCL.

SYCL uses a WYSIWYG editor for editing text. WYSIWYG is an acronym for What You See Is What You Get. It allows users to change text sizes, fonts and colours and add links to web pages, without needing to know HTML, the computer language of the web. It is a powerful tool, however it is very easy for an editor to disregard the rules of good design when using it, for example mixing up fonts and colours, and making a site look higgledypiggledy.

The sites are designed so that they work on all screen sizes from phones to retina screens on Apple workstations. We have plumped for Google/Wikipedia black on white theme, which should fit most situations, though when we have some funds we hope to splash out on improved graphic design.

SYCL also has a feature where satellite sites can contain the pages from a parent site, which brings a community together.

Notice the Not Secure message here. The Internet is perpetually throwing us challenges this is Google recently deciding that no information should pass over the Internet unless it is encrypted. This is a public web site and we WANT people to view this data. It does not need to be encrypted.

My heart sank when I first heard this - the SSL certificates which do the encrypting were expensive and fiddly to install. Also certificates only worked on named sites, and SYCL hosts hundreds of sites!

However, we have now learned of an open source certificate provider which will mean not only can we get certificates for free, but we can automate the installation process. We are using this on the MORPHmaster sites, we will soon apply it to SYCL and lose this red message. The Anatrack systems face a number of other challenges, some of these I have touched upon already.

# **Challenges for the Anatrack Portal Builders**

# Competition

Alternative content management systems, social media sites

• Legislation

GDPR, ePrivacy, Online Harms

Security

Email spammers, web site hacking, passwords

• Translation

Avoiding HTML, more language-country combinations than Microsoft, language selection UI, right-to-left scripts

• Presentation

Keeping contemporary, no in-house expertise, funding

# EVER CHANGING ONLINE ENVIRONMENT

competition, legislation, security, translation, presentation, the ever changing web environment

# COMPETITION

All our products face competition from alternative solutions

For the portals, there are many alternative content management systems, some free such as WordPress

- though we believe setup and site editing is easier in SYCL
- and it is certainly safer

- Facebook, Twitter and other social media platforms are also direct competitors

- as they allow users to quickly publish text and images
- but there is an increasing tendancy not to trust what is there

- one advantage of being a small company is that we are also agile. We can fix bugs very quickly, and can develop new features if we can think of them, and when funds are available.

### LEGISLATION

Keeping up with all the new legislation has been a challenge

You all know about GDPR, European regulation to protect the personal data of individuals, and make sure web sites ask explicit permission for collecting and using any such data.

It took a while to understand what was actually required, but we have implemented it across our entire web presence to what we believe is a good standard

ePrivacy regulation is upcoming and will reinforce the rules set out in GDPR, though we are not yet sure what this involves

And this month the UK government has announced the Online Harms initiative, which will need close attention. Harmful content will need to be quickly removed, easy for us now but more of a challenge as we scale.

Security is a continuing and growing issue

#### EMAIL SPAMMERS

Over the last year, and to both our amusement and frustration, we have had an increasing problem with email spammers

All our web sites have Contact us and Registration forms, people fill them in and administrators such as me and Robert are emailed with the form contents.

But there are many bots, which are bits of code, running on the Internet and filling out these forms automatically, which means that Robert and I have been bombarded with emails trying to sell us all kinds of shady products.

bitcoin brokering, plastic surgery and iphones, perfomance enhancing drugs and lots and lots of hot dates. They come in many different languages, possibly because our sites are in so many different languages.

But after a few attempts, we currently have the upper hand. I have laid what is called a honeytrap for the bots, which is an input box in the form placed off screen, so invisible to a human. The bots do not realise it is off the screen and fill it in, forms with the field filled in, we can ignore!

Not one bot has got past this latest trap, but we are sure this is an ongoing battle.

### THE CYBER WAR

While we have been concerned about the spammers, they are an inconvenience rather than a danger. However there is real danger.

I have programmed the web sites to email me when errors occur, so that I can fix bugs quickly.

However I get ten or twenty times the emails than were caused by the email spammers, from errors caused by proper hacking attempts, attempts to gain access to our platforms and to the data.

These errors are of two kinds:

many are calls to pages that do not exist - the hacker assumes our site is built with Wordpress so is looking to exploit holes in that system. By not being Wordpress, we have a distinct advantage.

others are injection attacks, a common way to get into a badly programmed system where the hacker attaches code to the URL, but I have programmed against these as well as my years of experience have taught me

Other security measures include

patching the servers regularly, to fix security vulnerabilities.

closing ports on the servers and installing firewalls.

But most breaches are caused by the hacker having access to passwords. Our sign up procedure, whereby every editor creates his own password via an email, guarantees that the right person is creating the password, and that only he knows it.

I am sure you know this, but please do not give your passwords to anyone else, especially not over email or any kind of messaging including WhatsApp.

In case things do go wrong, we do nightly backs of all the data in the systems to Amazon storage in Dublin.

### TRANSLATION

This has been a problem only because we support more language-country combinations than Microsoft. We have had to code around this issue but it seems to be working.

However, translation does throws up lots of challenges, not least because MORPHmaster now supports more language-country combinations than the Microsoft platform it is built on.

### PRESENTATION

This is a challenge because trends change so quickly on the web and because we have no in house design expertise. We have to prioritise efficiency over looking pretty.

# Conclusions

There is further work to do

SYCL

We would like to make SYCL more flexible

- currently you can only have a limited number of pages of a specific type;
- the change would mean you could have as many pages of a particular type

as you want.

Merge SYCL and MORPHmaster

It would be excellent to build a product where site content could be translated, while the editing tool was also in many languages; This would mean effectively merging SYCL and MORPHmaster.

### Intelligent GIS

Our longstanding vision is to merge all that we have learned about web development, content management systems, translation and mapping with the analyses and modelling that is built into Ranges, to create an Intelligent Geographic Information System (iGIS), with a Decision Support Engine behind, as we proposed in the TESSA bid to the European Commission.

Anyone with a question about the environment or a particular species would ask the iGIS, and it would return an answer based on the big data stored within, using expert knowledge and of course algorithms.

It just remains for me to say that it is a pleasure to be a member of this group, and I hope to meet everyone before tomorrow.

Thank you very much
